Bat Deterrence Service Preparation Sheet

Bat Description

There are many bats living in southern Utah. The two major families are the plain-nosed bats and the free-tailed bats. Bats can roost in a variety of locations so an in-depth knowledge of these attributes is imperative for proper control. Proper preparation is necessary for a successful service. The following steps must be completed prior to our treatment.

Step 1: Clear the exterior of your home to allow uninterrupted access to the perimeter of the property.

Step 2: Remove any excessive yard waste such as yard clippings, mulch piles, leaf litter, etc.

Step 3: Turn off your sprinklers if they are on directly before, during, or after our service application.

Step 4: Clean your home and remove debris from the floor (children's toys, cloths, etc.).

Step 5: Insure there is a safe location for our pest control specialists to access the roof.

Step 6: The service *may* require the removal of roof tile, attic insulation, or fascia. In the event that such actions become necessary to properly provide a quality service we will need those areas fully cleared. Your pest control specialist will advise you if this will be necessary.

After the Treatment

It is important to note that we will do everything we can to humanely deter bats from your home. Some bat deterrence services have an ongoing program attached to them depending on the deterrence technology being used. This will be fully explained before any work is done.
